An example: We want to vectorize these 4 sentences<sup>1</sup>:

1. Hello, how are you!
2. Win money, win from home.
3. Call me now
4. Hello, Call you tomorrow?

---

<sup>1</sup>Example from Rahul Vasaikar

# Vectorizing the Text: Count Vectorizer

1. We first build a vocabulary:

*vocabulary =*

*{are, call, from, hello, home, how, me, money, now, tomorrow, win, you}*

2. Then, we vectorize each sentence based on the occurness of each word:

	are	call	from	hello	home	how	me	money	now	tom...	win	you
1	1	0	0	1	0	1	0	0	0	0	0	1
2	0	0	1	0	1	0	0	1	0	0	2	0
3	0	1	0	0	0	0	1	0	1	0	0	0
4	0	1	0	1	0	0	0	0	0	1	0	1

It is possible to show that accuracy is minimized, on average, by a very simple classifier that assigns each observation to the most likely class, given its predictor values. In other words, we should simply assign a test observation with predictor vector  $\mathbf{x}_0$  to the class  $j$  for which

$$P(Y = j \mid \mathbf{X} = \mathbf{x})$$

is largest.

# Bayes Classifier: Naive One!

We make two assumptions:

1.  $X_1, X_2, \dots$ , and  $X_m$  are independent from each other;
2.  $X_1, X_2, \dots, X_m \mid Y \sim MN(\cdot, p_1, p_2, \dots, p_m)$

$$\begin{aligned} P(Y=j \mid \mathbf{X} = (x_1, x_2, \dots, x_m)) &= \frac{P(\mathbf{X} = (x_1, x_2, \dots, x_m) \mid Y=j) \cdot P(Y=j)}{P(\mathbf{X} = \mathbf{x})} \\ &= \frac{P(X_1 = x_1 \mid Y=j) \cdot \dots \cdot P(X_m = x_m \mid Y=j) \cdot P(Y=j)}{P(\mathbf{X} = \mathbf{x})}. \end{aligned}$$

$$\begin{aligned} \hat{y} &= \arg \max_{j \in \text{classes}} \frac{P(X_1 = x_1 \mid Y=j) \cdot \dots \cdot P(X_m = x_m \mid Y=j) \cdot P(Y=j)}{P(\mathbf{X} = \mathbf{x})} \\ &= \arg \max_{j \in \text{classes}} P(X_1 = x_1 \mid Y=j) \cdot \dots \cdot P(X_m = x_m \mid Y=j) \cdot P(Y=j). \end{aligned}$$

# Hyperparameters

Two important hyperparameters:

1. Size of the vocabulary;
2. Laplace/ Lidstone smoothing parameter( $\alpha$ ).

# Size of Vocabulary

It is convex! (to be completed)

# Laplace/ Lidstone Smoothing Parameter( $\alpha$ )
